Enduro Upper Control Arms

The Drivetech 4x4 Enduro Upper Control Arms are now available. The Enduro Upper Control Arms are the solution to correct wheel alignment issues in your IFS 4WD.

An issue with the modern day IFS 4WD is the limited adjustment range which impacts successful wheel alignment. This becomes even more of an issue when the vehicle is lifted by more than one inch. Not only does the vehicle run into camber and caster issues, but ball joint articulation and clearance issues to the coil over strut at ride and droop height. The new Drivetech 4x4 Enduro Upper Control Arms are the solution to these issues. Featuring built in increased camber and caster angles, greater clearance to the coil over strut and more articulation of the arm by virtue of new maintenance free GIIRO bushing technology.

Features:

- Fixed camber and caster for raised height vehicles between 35-50mm
- Designed for 35-50mm lift means no adjustability required to prevent slipping
- Built tough utilising 1020 grade forged ball joint housing, forged end-rings and 1020 DOM tubing with 360° welds
- Heavy duty, grease-able, chromoly ball joints with increased articulation for improved travel and minimal binding
- GIIRO - the ultimate touring bushing with increased articulation whilst being lubrication and maintenance free
